General objectives: Using the checklist, the Supervisors will be able to: • identify technical, organizational and procedural safety issues at work have to be controlled and monitored • design and construction documents to the functional detection and updating of data related to safety issues at work	
Using the checklist, the Supervisors will be able to: • identify technical, organizational and procedural safety issues at work have to be controlled and monitored • design and construction documents to the functional detection and updating of data related to safety issues at work	
 identify technical, organizational and procedural safety issues at work have to be controlled and monitored design and construction documents to the functional detection and updating of data related to safety issues at work 	
have to be controlled and monitored • design and construction documents to the functional detection and updating of data related to safety issues at work	
design and construction documents to the functional detection and updating of data related to safety issues at work	k
updating of data related to safety issues at work	
 program monitoring, overseeing and managing the safety aspects. 	
Description of the research project:	
Starting from the need to define a management tool to support the	
Supervisors:	
identifying and overseeing aspects of safety at work of their	
relevance	
in building a systemic framework of the information collected	
was built a checklist consists of 64 checkpoints, divided into 10 sections. I addition to the data collection, the check shows the improvement actions that can be acted out directly by the coordinator on their own, in a territory under its jurisdiction and control in its area of action and intervention. At each check point are one or more upgrading and / or solving problems.
